

Oil

Jack Schwartzman

- Oil is a main necessity for everyday activities and is used amongst our daily lives with things such as driving a car, producing heat, producing electricity and more all of which require oil products.
- The process in which we acquire the oil from its natural state is very harmful to the environment, and lets off a lot of harmful chemicals into the atmosphere, as well as damaging the land that was mined upon.
- Oil is a very scarce commodity and is often fought over, whether it is a war for land that has oil on it, or the people protesting against the state for trying to protect their neighborhood from being drilled on.
- We can put a help to stop this damage to our environment by being more cautious of how we use this product. We can do so by avoiding using fossil fuels in the first place, or even just using less than most people would. Any change is a good change.
